Dars haqida

Django loyihasi **app** (ilova)lardan tashkil topadi. Bu darsda yangi app yaratamiz, uni loyihaga ulaymiz va brauzerda birinchi **Hello World** sahifasini chiqaramiz.

Dars yakunida siz quyidagilarni bilasiz:

- Loyiha (project) va ilova (app) farqi;
- Yangi app yaratish va ro'yxatga olish;
- View (ko'rinish) yozish;
- URL manzil ulash (include);
- Template (HTML) ko'rsatish.

1. App yaratish

App — loyihaning mantiqiy bo'lagi (masalan: blog, do'kon, foydalanuvchilar). Yangi app yaratamiz:

```
python manage.py startapp newapp
```

So'ng uni config/settings.py ichidagi **INSTALLED_APPS** ro'yxatiga qo'shamiz:

```
INSTALLED_APPS = [
    # ...
    'newapp',
]
```

2. View yozish

View — so'rovni (request) qabul qilib, javob (sahifa) qaytaruvchi funksiya yoki klass. Biz klass asosidagi View yozamiz:

```
from django.shortcuts import render
from django.views import View

class HelloWorldView(View):
    def get(self, request):
        return render(request, 'hello_world.html')
```

3. URL ulash

Avval app ichida newapp/ur ls.py yaratamiz:

```
from .views import HelloWorldView
from django.urls import path

urlpatterns = [
    path('', HelloWorldView.as_view(), name='hello_world'),
]
```

So'ng uni asosiy config/ur ls.pyga ulaymiz:

```
from django.urls import path, include

urlpatterns = [
    path('admin/', admin.site.urls),
    path('hello/', include('newapp.urls')),
]
```

4. Template (HTML) yaratish

App ichida `newapp/templates/hello_world.html` faylini yaratamiz:

```
<!DOCTYPE html>
<html>
<head><title>Hello</title></head>
<body>
  <h1>Hello, World!</h1>
  <p>This is a simple Django template.</p>
</body>
</html>
```

5. Natijani ko'rish

```
python manage.py runserver
# Brauzer: http://127.0.0.1:8000/hello/
```

Qanday ishlaydi?

- Brauzer `/hello/` manzilini so'raydi;
- `config/urls.py` uni `newapp/urls.py` ga yo'naltiradi;
- View `hello_world.html` shablonini qaytaradi.

Amaliy topshiriq

Mustaqil bajaring:

1. 'newapp' app yarating va `INSTALLED_APPS` ga qo'shing;
2. `HelloWorldView` yozing va URL ulang;
3. o'z ism-familiyangizni chiqaruvchi HTML sahifa yarating.
